

GET THEM OFF TO THE STRONGEST START: VACCINATE FROM DAY 1

is when chickens are most susceptible to **Salmonella infection**

EARLIER VACCINATION = EARLIER PROTECTION

A study performed on commercial layer farms, reflecting real-life scenarios, showed that **successful vaccination is possible from as early as Day 1 with AviPro Salmonella Duo¹...**

AviPro Salmonella Duo is stable in drinking water for a long period of time

The vaccine strains were still above the minimum batch release quantity for each strain.

Very young birds drink enough to achieve vaccination

All birds vaccinated on Day 1,2,3 or 5 of life tested positive for vaccine strains 2 days post vaccination.

Birds vaccinated earlier achieve higher levels of vaccine strains in the gut

Colonisation of the caeca with both vaccine strains was higher in birds vaccinated on day 1 and 2 than those vaccinated on day 5.

This data shows that, with AviPro Salmonella Duo, **WATER INTAKE IS ADEQUATE IN THE FIRST WEEK OF LIFE TO ACHIEVE SUCCESSFUL VACCINATION**, regardless of the water holding capacity of the system.

AviPro Salmonella Duo is the only live dual-strain vaccine containing *S. Enteritidis* & *S. Typhimurium*

◆ Provides superior direct protection² against both regulated strains of *Salmonella*³ in layers
